

VIKRAM MADHYASTA

Murdeshwari, Karnataka 581421 | vikrammadyasta@gmail.com | +91 9353172296 | [LinkedIn](#) | [GitHub](#)

PROFESSIONAL SUMMARY

Cloud & DevOps engineer (M.E. Cloud Computing, MAHE Manipal) with hands-on, project-driven experience building AWS, Kubernetes, Terraform, Jenkins, and GitOps-based CI/CD systems. Comfortable owning a pipeline end-to-end from infrastructure provisioning to deployment automation to failure diagnosis. Available immediately for full-time roles.

TECHNICAL SKILLS

Cloud (AWS): EC2, ASG, ELB, S3, EBS, EFS, RDS, Aurora, DynamoDB, Lambda, API Gateway, ECR, CloudWatch, IAM, VPC, CloudFront, Route 53

Containers & Orchestration: Docker, Kubernetes, ArgoCD (GitOps)

CI/CD: Jenkins, GitHub Actions, Git, GitHub

Infrastructure as Code: Terraform, Ansible

Programming & Data: Python, Java (fundamentals), SQL, DBMS

Systems & Fundamentals: Networking (TCP/IP, OSI model), Operating Systems, Data Structures & Algorithms, Linux (Ubuntu)

PROJECTS

Cloud-Native CI/CD & GitOps Platform with AI-Based Jenkins Log Analysis | [GitHub](#)

Tools: Jenkins, Docker, Kubernetes, ArgoCD, AWS (ECR, EC2), Git/GitHub, Python, OpenAI API

- Built an end-to-end GitOps CI/CD pipeline (GitHub → Jenkins → AWS ECR → ArgoCD → Kubernetes) that eliminated 100% of manual image build, push, and deployment steps.
- Containerized the application with Docker and automated image builds and secure pushes to a private AWS ECR registry via Jenkins, using scoped Jenkins credentials with zero hard-coded secrets.
- Configured ArgoCD for declarative, auditable Kubernetes deployments, removing all manual kubectl apply operations from the release process.
- Integrated an OpenAI-powered log analyser into the Jenkins failure hook that auto-diagnoses root cause and suggests a fix, cutting failure-triage time from an estimated 15-20 minutes of manual log review to under 2 minutes

Serverless ML Inference API for Crop Yield Prediction | [GitHub](#)

Tools: AWS S3, Lambda, API Gateway, CloudWatch, IAM, Python, Scikit-learn

- Designed a fully serverless ML prediction system (S3 → Lambda → API Gateway) that runs entirely within AWS Free Tier, achieving zero idle infrastructure cost with no EC2.
- Solved a hard Lambda deployment-size constraint by extracting trained model coefficients into a lightweight JSON artifact and re-implementing inference as pure Python arithmetic cutting the deployment package from a 50MB+ sklearn bundle to under 1MB.
- Exposed predictions through a REST API (POST /predict) via API Gateway with Lambda proxy integration, and configured least-privilege IAM roles for secure S3-to-Lambda access.
- Enabled centralized monitoring through CloudWatch (execution logs, request counts, latency), giving full visibility into a production-style request path with no dedicated server to manage.

AWS Infrastructure Automation with Terraform (IaC) | [GitHub](#)

Tools: Terraform, AWS (VPC, EC2, S3, DynamoDB, IAM), Git/GitHub, GitHub Actions

- Replaced manual, console-driven AWS provisioning with a modular Terraform codebase (VPC, security-group, and EC2 modules) cutting infrastructure setup from an estimated 30-45 minutes of manual clicking to under 5 minutes with a single terraform apply.
- Implemented a remote backend with S3 state storage and DynamoDB state locking, preventing concurrent-run state corruption and enabling safe, reproducible infrastructure across runs.
- Built a GitHub Actions CI/CD pipeline that automatically runs terraform init, validate, plan, and apply on every push, enforcing infrastructure-as-code discipline with zero manual deployment steps.

EDUCATION

M.E., Cloud Computing - Manipal School of Information Sciences (MSIS), MAHE, Manipal | Expected 2027, CGPA 8.28

B.E., Computer Science & Design Engineering - Dayananda Sagar Academy of Technology & Management (VTU), Bangalore | 2025, CGPA 7.1

CERTIFICATIONS

- AWS Cloud Practitioner Essentials (AWS Training and Certification)
- AWS Cloud Foundations (AWS Academy)
- AWS Cloud Architecting (AWS Academy)
